

RS 6102 VHF COMM TRANSCEIVER

The RS 6102 is 800 channels, 25 kHz spacing VHF transceiver designed specifically for a wide range of general aviation aircraft including helicopters. It incorporates the built-in intercom system providing communication between pilot and co-pilot without additional accessories. All tuning is done electronically since a digital frequency synthesizer has been employed. Keyboard frequency programming makes channeling simple and quick. Frequency is displayed on seven-segment LED readouts dimmed automatically according to the cockpit ambient light level.
